

From report chasing to numbers you can trust.

A working synthetic prototype connects collection, verification and leadership visibility.

ACQUIRE → VERIFY → UNDERSTAND

Visibility starts with getting the data.

Amanda retrieves and consolidates recurring reports. Debie needs dependable numbers for decisions. Manual handoffs sit between them.

01

Repeated retrieval

The same reports, different dates.
Portal exports and spreadsheet
handoffs.

02

Trust before speed

Overlapping sources, refunds, missing
fields and stale periods need controls.

03

Decisions downstream

A dashboard helps only when the data
behind it can be explained.

One connected workflow. Three clear layers.

Acquire a report. Verify the exact file. Make the published result accessible.

01

Acquire

Versioned replay
Dates and report parameters
Real synthetic CSV download

02

Verify

Checksum + raw archive
Parse, reconcile, deduplicate
Preserve last-good publication

03

Understand

API-backed dashboard
Coverage and definitions
Pinned source evidence

Built, connected and exercised.

The frozen P0 path is implemented. The presentation stays explicit about what is working and what remains a roadmap.

01

Working now

Report collection + manual upload
Verification + real import
Operations + leadership + drilldown

02

Trust controls

Replay and overlap no-ops
Explicit approved corrections
Rejected rows and safe failure

03

Clearly deferred

Nine live connections
Production Copilot / Jev
Business Central posting

A number with its scope and evidence.

September 30 · 128 acquired rows · \$7,127.78 demo net sales.
Item sales minus refunds; shipping, tax and fees excluded.

Keep the proof beside the answer.

Displayed metric run → supporting row → original source fields → exact CSV checksum and import batch.

RECORDED SYNTHETIC DEMO · 4/8 · Keep the proof

Metric run → supporting rows → original CSV and import batch.

Goodwill Michiana · Synthetic reporting prototype

Financial values come from verified source records.

Test the behavior, not just the happy path.

Browser acceptance uses Jack mc's handwritten ledger and a separate raw-CSV reader for acquired files.

01

\$10.01 → \$10.01

An identical upload does not double the ledger.

02

\$15.76 → \$14.76

A correction changes publication only after explicit approval.

03

\$24.00 / \$5.00

All ledger rows / unknown-store rows.
Missing source data stays unavailable.

Change dates. Replay. Fail safely.

The recorded demo shows the actual local application.
Synthetic records · simulated portal · offline synthetic narration.

Reuse the tools. Validate the live workflow.

The next step is a supervised, approved source pilot—not nine integrations at once.

01

Confirm the source

Access, real formats, report authority
and overlap rules with Goodwill.

02

Fit Microsoft

Validate workbook/Power BI
consumption, tenant policy and identity.

03

Measure and support

Baseline handling time and reliability.
Name owners, rollback and acceptance
criteria.

Collect the report. Keep the proof. Understand the number.

The working prototype joins the upstream reporting task to trustworthy visibility.

ACQUIRE → VERIFY → UNDERSTAND
