

From report chasing to a clearer daily picture.

Teach a workflow once. Keep the proof. Put answers beside the dashboard.

COLLECT → VERIFY & DELIVER → UNDERSTAND

The dashboard problem starts before the dashboard.

Amanda needs reports to arrive. Debie needs dependable visibility. Manual retrieval and consolidation connect the two.

01

Amanda

Upright is the repeated, date-changing task. Her 30–45 minute estimate includes interruptions.

02

The handoff

Reports feed Excel, Sonia's summary and existing Power BI. Compatible delivery matters.

03

The commitment

Amanda's nonbinding LOI expresses interest. Access, a pilot and purchase are not approved.

Bring fragmented reports into a controlled workflow.

Share acquisition mechanisms. Keep source meaning, parsing and overlap rules specific.

connected local replica Upright Paid-order sales · portal initiation	connected local replica Cash Monkey Unit/order sales · portal CSV export	fixture / access pending Jewelry Provided report · mappings unconfirmed

Teach the task once. Change the dates next time.

Reports → Paid orders → Dates → Generate → Ready → Download.

01

Record

Actual local DOM actions and date parameters.

02

Review

A bounded recipe with an explicit operator approval.

03

Replay

Real browser execution and a verified CSV artifact.

Amanda shows the workflow.

Record September 29. Review the captured actions. Approve the recipe before replay.

New dates. The same reviewed task.

Replay September 30 for Upright,
then Cash Monkey. Watch genuine
browser frames and import
evidence.

AIMSIGH / 06

A changed page needs an explicit decision.

A mismatched control stops replay. The operator reviews and approves a new recipe. Last-good data stays available.

01

Bounded execution

Known local destinations and permitted operations.

02

No bad publication

Wrong dates, missing reports or failed checks cannot become new financial totals.

03

Jev is conditional

Probabilistic decision adapter is a future approved option. Main demo is model-free.

One published snapshot. Every result keeps its lineage.

Raw file → staging → versioned sales → published rows → snapshot → workbook, charts and answers.

Actual local Python + SQLite implementation. Money is calculated with integer cents and Decimal; inputs are combined after aggregation at their own grains.

Give Amanda a usable workbook.

A monthly summary, 30 daily tabs,
normalized records, modeled inputs
and source evidence—all from the
same snapshot.

Source Evidence

Fictional sales; invented labor/shipping assumptions. This preview reads cached values from the downloaded workbook, not an Excel application screenshot.

Snapshot: af6902a4d40023ab704cf653b9c50b2f5dbe3e1fc5657bed293b8fad57efbb

Preview rendered from the actual exported XLSX values

Sales are measured. The model is disclosed.

Demo net sales = item sales – refunds. Shipping collected, taxes and fees are excluded from that metric.

01

Labor assumptions

Upright: 2 h/store/day, then 3 h from Sept 24. Cash Monkey: 0.5 h/store/day.

02

Cost assumptions

Source fees; invented \$3.50 shipping/record and \$20/h labor.

03

Contribution margin

Net sales less fees, modeled shipping and labor. Excludes overhead and taxes.

The charts follow the verified data.

Daily trends, source and store breakdowns, productivity, coverage and freshness share the selected snapshot.

Revenue rose. Modeled hours rose faster.

The productivity comparison uses
matched sales and invented labor
inputs across two seven-day
periods.

“Why is revenue per labor hour down?”

A Teams-style local channel answers supported questions with deterministic tools, periods, definitions and evidence links.

What changed in productivity?

Inspect both periods

September 17–23 compared with September 24–30

SEPTEMBER 17–23

\$144.59/hr

\$60,727.56 sales · 420.00 hrs

SEPTEMBER 24–30

\$104.94/hr

\$61,706.64 sales · 588.00 hrs

September 17–23: \$60727.56 sales / 420.00 invented hours = \$144.59/hour. September 24–30: \$61706.64 sales / 588.00 invented hours = \$104.94/hour. The change follows the sales and modeled hours shown here. This is an arithmetic comparison, not a verified business cause. Sales increased, but invented labor hours increased faster, so revenue per labor hour fell.

Observed arithmetic under invented labor allocations; not a verified business cause.
